

Requirement Analysis Customer Journey Map

Date	29 September 2026
Team ID	SWTID-2026-3488
Project Name	Import Data using Transform Maps (Spreadsheet)

A system administrator prepares, imports, transforms and validates employee data from a spreadsheet into ServiceNow. (Structure follows the Entice – Enter – Engage – Exit – Extend model used in the sample Customer Journey Map.)

	Entice	Enter	Engage	Exit	Extend
Steps	Receives spreadsheet from HR / project owner and decides to bulk-import it	Prepares and cleans the spreadsheet; opens ServiceNow; creates the target table	Loads data (Import Set), creates Transform Map, maps fields, sets Coalesce	Runs the transform and checks Transform History and target table records	Documents results; reuses the map for future files or automates the import
Interactions	Email / shared drive; Excel	Excel; ServiceNow Tables & Columns module	System Import Sets > Load Data; Transform Maps form; Field Maps related list	Transform History; target table list view; filters and reports	Project documentation; Data Source & Scheduled Import (future)
Goals & motivations	"Help me avoid typing hundreds of records by hand."	"Help me make sure the data is clean before I load it."	"Help me map each column to the right field without mistakes."	"Help me confirm that every row was created correctly."	"Help me repeat this quickly next time."
Positive moments	Clear source data; a defined deadline	Sample dataset makes testing easy	Visible field mapping; Coalesce prevents duplicates	Inserted count matches row count; records appear in the list	Reusable Transform Map saves time
Negative moments	Unclear or inconsistent spreadsheet format	Blank cells, duplicate IDs, wrong data types	Confusing mappings; mandatory fields missed	Ignored / skipped / error rows with unclear reasons	Repeating manual steps for each new file
Areas of opportunity	Provide a fixed spreadsheet template with headers	Add a pre-import checklist (unique IDs, no blanks)	Use auto-map matching fields; document each mapping	Review the error log and fix root causes; add onBefore validation	Use scheduled Data Sources and notifications on failure
