

Project Design Phase Solution Architecture

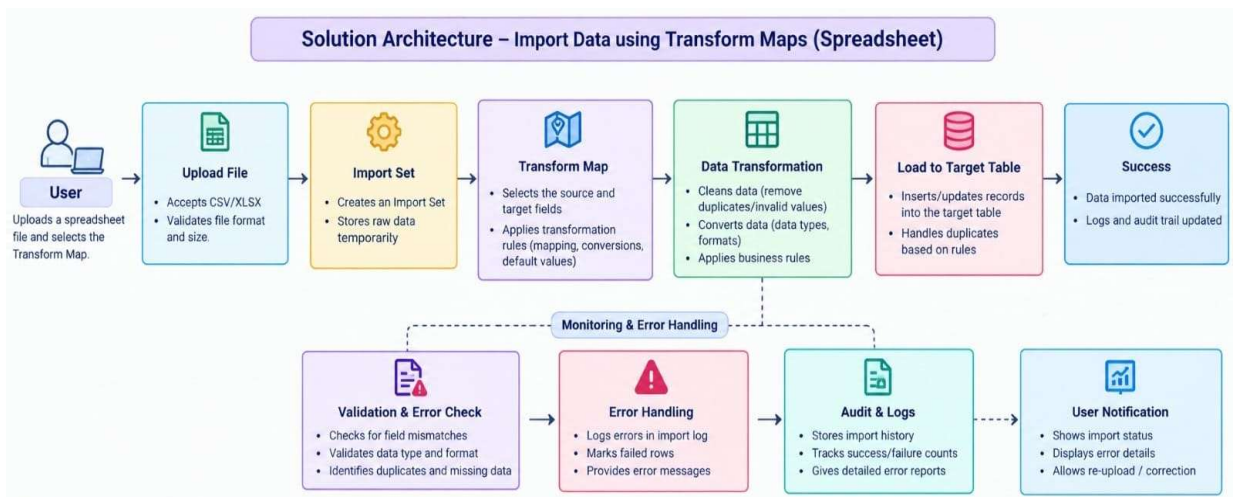

Date	30 September 2026
Team ID	SWTID-2026-3488
Project Name	Import Data using Transform Maps (Spreadsheet)

Solution Architecture:

Solution architecture is a complex process – with many sub-processes – that bridges the gap between business problems and technology solutions. Its goals are to:

- Find the best tech solution to solve existing business problems.
- Describe the structure, characteristics, behaviour, and other aspects of the software to project stakeholders.
- Define features, development phases, and solution requirements.
- Provide specifications according to which the solution is defined, managed, and delivered.

Solution Architecture Diagram:

Architecture Flow:

Step	Component	Description
1	Source spreadsheet	Employee data (Employee ID, Name, Email, Department, Location) in .xlsx
2	Load Data	System Import Sets > Load Data uploads the file and creates the Import Set table
3	Import Set (staging) table	Holds raw rows so they can be reviewed before transformation
4	Transform Map	Defines source table, target table, field maps and Coalesce field
5	Run Transform	Inserts new records and updates existing ones in the target table
6	Target table (u_employee)	Final employee records used by the platform
7	Validation	Transform History and target list view confirm inserted / updated / error counts
